Super Gyp

A micronised liquid suspension of natural Gypsum boosted with Boron for use in all farming systems to build soil structure and plant health.

Benefits

- ✓ Super Gyp is an efficient tool for manipulating soil structure and chemistry by breaking heavy clays, inducing oxygen, and creating crumbing structure.
- ✓ Micronised particles have high surface area to volume ratios, meaning high reactivity. Ideal for purging sodium from the soil colloid, especially when soils do not require large calcium inputs.
- ✓ Improve the rate of return on your financial inputs with a fast acting and effective natural gypsum.
- ✓ Improve plant metabolism with calcium and sulphur, two key elements in all plants for the conversion of nitrogen into protein, particularly in cereals and brassicas.
- ✓ As a compact and easy to store product, Super Gyp provides a cost-efficient option when transporting and applying gypsum.
- ✓ A perfect addition to any precision-ag practices, including VRT, injection systems and flood jetting, allowing for superior coverage and uniform application across plants and soil.

Typical Analysis

	G/L	% W/V	%W/W
Calcium (Ca)	170	17.0	12.3
Sulphur (S)	128	12.8	9.3
Boron (B)	1.8	0.18	0.13
Organic Carbon (C)	2.7	0.27	0.20
pH	7.8 – 8.7		
SG	1.28 – 1.42		

Application Rates

Application	Rate/Ha	Water
Boom spray: Soil Application (Coarse Spray Applicator)	5 - 50L	80 – 500L/Ha
Fertigation/Pivot	10 - 30L	Variable with good agitation
Liquid Injection	2 – 5L	Variable with good agitation

Note:

1. Agitate concentrate thoroughly before use. Once in the tank, maintain agitation. Do not leave solution in tank without agitation for extended periods of time as settling can occur.
2. For trouble free application, it is best to apply product through a boom jet nozzle, or fan/flood jets.

Packaging: 20L, 200L and 1000L
